

GGCMI brings together a diverse international community of crop modelers for climate impact assessment, model intercomparison, and model improvement at the global scale

Background and Motivation In 2012 AgMIP led a fast-track multi-model intercomparison in coordination with the Inter-Sectoral Impacts Model Intercomparison Project (ISI-MIP). The fast-track assessment projected climate change impacts using global high-resolution crop models driven by CMIP5 inputs. The project culminated with the submission of 6 papers to a special issue of PNAS (Figures 1 and 2). Initial results demonstrate the potential of global gridded crop model simulations and the need to further improve understanding of mechanisms, assumptions, and uncertainties of model design and execution.

Objectives and Activities Following the success of the 2012 fast-track project, GGCMI aims to continue to build the community of GGCM researchers through protocol-based research. This community will develop consistent methodologies, including simulation protocols and evaluation metrics, for intercomparison and improvement of gridded model applications. Core activities for the next three years include:

- Historical simulations for model evaluation
- Analysis of model sensitivity to carbon, temperature, water, and nitrogen (CTWN)
- Coordinated global impact assessments

Membership GGCMI currently includes more than 14 modeling groups from 8 countries and we actively encourage the participation of new groups. For those that have experience running gridded models regionally, GGCMI can provide the necessary data products and support to scale existing models to global simulations.

Coordination GGCMI is coordinated by an interdisciplinary team from **University of Chicago, US DOE Argonne National Laboratory, NASA GISS, and PIK.**

Data and IT GGCMI maintains an archive of all associated data products and model outputs that provides:

- A key service to the climate impact community
- A tool for ongoing risk assessment and decision support
- A resource for collaborations within the GGCMI network

GGCMI leverages existing IT infrastructure developed at ANL for the 2012 fast-track.

Timeline The current phase of GGCMI started in April of 2013 and will run for three years, with each of core activities including phases for planning, simulation, analysis, and publications.
